I. Overview: What is an Unmanned Aircraft System?

An unmanned aircraft system (UAS) can be defined as an aircraft without an operator or flight crew onboard. They are remotely controlled using manual flight control (i.e., teleoperation) or autonomously using uploaded control parameters (e.g., waypoints, altitude hold, or minimum/maximum airspeed).

UAS are typically used to perform a variety of tasks or applications that are considered too dull, dangerous, dirty, or deep for humans or manned platforms (i.e., 4Ds). Their civilian/commercial uses include aerial photography/filming, agriculture, communications, conservation/wildlife monitoring, damage assessment/infrastructure inspection, fire services and forestry support, law enforcement/security, search and rescue, weather monitoring and research. They provide an option that is economical and expedient, without putting a human operator (i.e., pilot) at risk.

UAS are commonly referred to as unmanned aerial vehicles (UAV)s, unmanned aerospace, aircraft or aerial systems, remotely pilot aircraft (RPA), remotely piloted research vehicle (RPRV), and aerial target drones. However, the term UAS itself is reflective of a system as a whole, which has constituent components or elements that work together to achieve an objective or set of objectives. These major elements, depicted in Figure 1, include the air vehicle element, payload, data-link (communications), command and control (C2), support equipment, and the operator (human element).

![Basic UAS configuration with major elements identified.](image-url)
The UAS you will develop in this challenge is comprised of the same such elements. NOTE: For purposes of component categorization and functionality simplification, the data-link/communications and command and control (C2) have been combined into a single element (i.e., command, control, and communications [C3]). Each team will choose different quantities, sizes, types, and configurations of the various components to create a unique UAS design using the approach depicted in Figure 2.

![Figure 2. UAS design approach with major element options identified.](image)

A high-level description of each of the system elements, tailored to this challenge, follows. Many of these items are described in more detail in later sections.

**Payload Element(s)**

The payloads represent the first element to be examined in the design of a UAS as it traditionally represents the primary purpose of the platform. In the case of this challenge, the main payload is a package, but your aircraft must also have sensors to detect obstacles and for the aircraft to know its position. The following provides common examples of Visual/exteroceptive sensors. These sensors are used to capture information regarding the operating environment. This information can be used to provide situational awareness relative to the orientation and location of the aerial vehicle element. The following represent the major primary payload categories to consider in the design and development of a UAS:
• **Visual/exteroceptive sensors** – used to capture information (e.g., visual data) regarding the operating environment to provide the operator with situational awareness relative to the orientation and location of the aerial vehicle element (e.g., unmanned aerial vehicle [UAV]) of a UAS. The following represent the examples of common payload sensors:
  o **CCD/CMOS camera (e.g., Daytime TV, color video)** – digital imaging sensor, typically returns color video for live display on the ground control station (GCS) terminal
  o **Thermal (e.g., infrared [IR])** – sensor used to measure and image heat (i.e., thermal radiation)
  o **LiDAR** – measures distance and contours of remote bodies (e.g., terrain) through use of reflected laser light, typically requires significant amount of pre or post-processing to render and display the data
  o **Synthetic Aperture Radar (SAR)** – measures distance and contours of remote bodies (e.g., terrain) through use of reflected radio waves, typically requires significant amount of pre or post-processing to render and display the data
  o **Multispectral camera** – an all-encompassing visual sensor for capturing image data across the electromagnetic spectrum (e.g., thermal, radar, etc.)

**NOTE:** While these options are optional, it is highly suggested that a minimum of a CCD/CMOS camera be included in the UAS design to visually confirm orientation/location of the aircraft (see Primary video data equipment [non-payload] in the following subsection). Additionally, proprioceptive (onboard) sensors can be used to augment the payload sensors to improve situational awareness and determine a more accurate depiction of the state of the aircraft.

The details concerning these elements, including catalog equipment options, can be found in the Catalog Options section of this document.

**Air Vehicle Element**
The air vehicle element (i.e., UAV) represents the remotely operated aerial component of the UAS. There can be more than one UAV in a UAS and each is composed of several subsystem components, such as the following:

• **Airframe** – the structural aspect of the vehicle. The placement/location of major components on the airframe, including payload, powerplant, fuel source, and command, control, and communications (C3) equipment, will be determined by your team. This element can be purchased as a commercially-off-the-shelf (COTS) option from the catalog (or other sources) or custom designed by your team

• **Flight Controls** – the flight computer (e.g., servo controller), actuators and control surfaces of the air vehicle

• **Powerplant (propulsion)** – the thrust generating mechanism, including the engine/motor, propeller/rotor/impeller, and fuel source (e.g., battery or internal combustion fuel)

• **Sensors (onboard)** – the data measurement and capture devices

**NOTE:** These subsystem components can be purchased as a single COTS option from the catalog or other source (i.e., included in COTS airframe), modified/supplemented using other options, or entirely custom designed by your team.
The details concerning this element, including catalog equipment options, can be found in the section Air Vehicle Element Selection Guidelines and Catalog Options of this document.

**Command, Control, and Communications (C3) Element**

C3 represents how your team will get data to (e.g., control commands) and from (e.g., telemetry and onboard sensor video) the air vehicle element (or any additional unmanned/robotic systems), while in operation. Your configuration will depend on the design choices made by your team. Some of these items will be included in the weight and balance calculations for the Air Vehicle Element (i.e., airborne elements), while the remaining will be included in the ground control station (GCS). The following image (Figure 3), depicts an example C3 interface overview of a medium complexity UAS.

![Figure 3. Example C3 configuration and associated interfaces.](image)

The following represents the primary C3 element subsystem components:

- **Control commands and telemetry equipment** – the capture, processing, transmission, receipt, execution, and display of all data associated with control and feedback of the air vehicle element. The following represent the types of controls:
  - **Manual** – operator performs remote control of the UAV
  - **Semi-autonomous** – operator performs some of the remote control of the UAV, system performs the rest (pre-determined prior to flight)
o **Autonomous** – operator supervises system control of the UAV (pre-determined prior to flight and uploaded during flight)
o **Control switching** – use of a multiplexer device provides a method to switch between different control methods (e.g., switch between manual and autonomous control)

- **Primary video data equipment (non-payload)** – the capture, transmission, receipt, and display of visual data from the primary video sensor (non-payload), if applicable.

  NOTE: **Primary video is typically used to operate the aircraft from an egocentric (i.e., first person view [FPV]) perspective**

- **Remote sensing (primary payload sensor) equipment** – the capture, storage or transmission and display of data from the primary payload sensor.

The details concerning this element, including catalog equipment options, can be found in the Command, Control, and Communications (C3) Selection Guidelines and Catalog section of this document.

**Support Equipment Element**

Support equipment represents those additional items required to assist in UAS operation and maintenance in the field. These can include, but are not limited to the following:

- **Launch and recovery systems** – components used to support the UAV to transition into flight or return the aircraft safely
- **Flight line equipment** – components used to start, align, calibrate, or maintain the UAS
  - Refueling/recharging system
  - Internal combustion engine starter
- **Transportation** – used to deliver equipment to the operating environment
- **Power generation** – portable system capable of producing sufficient power to run the GCS and any additional support equipment; typically internal combustion using gasoline
- **Operational enclosure** – portable work area for the crew, computers, and other support gear

The details concerning this element, including catalog equipment options, can be found in the Support Equipment Selection Guidelines and Catalog section of this document.

**Operator Element**

The operator element represents those personnel required to operate and maintain the system. These roles will be dependent on the design of the system. These can include, but are not limited to the following:

- Pilot in command (PIC)
- Secondary operator (co-pilot or spotter)
- Payload/sensor operator
- Sensor data post-processer specialist
- Support/maintenance personal

NOTE: **You will identify your crew needs based on your UAS design according to the provided guidelines. For example, if the payload is configured to automatically detect over specific areas identified using GPS,**
specific operator may not be necessary. However, the appropriate system design would need to be established to support such operations.

The details concerning this element can be found in the UAS Personnel/Labor Guidelines section of this document.
II. Package Delivery Mission Challenge Details

Small Unmanned Aircraft Systems (sUAS) have near-term potential for numerous civil and commercial applications. The FY20 RWDC State challenge will continue the focus on Unmanned Aircraft Systems and implementation of a UAS. This year’s mission is to support package delivery in an urban environment. The teams will use concepts from Engineering Technology (i.e., application of science and engineering to support product improvement, industrial processes, and operational functions) to identify, compare, analyze, demonstrate, and defend the most appropriate component combinations, system/subsystem design, operational methods, and business case to support the challenge scenario. Through use of an inquiry-based learning approach with mentoring and coaching, the students will have an opportunity to learn (and apply) the skills and general principles associated with the challenge in a highly interactive and experiential setting. For example, the students will need to consider and understand the various Unmanned Aircraft System elemental (subsystem) interactions, dependencies, and limitations (e.g., power available, duration, range of communications, functional achievement) as they relate to the operation, maintenance, and development to best support their proposed business case.

To support the inquiry-based learning approach, each team will perform and document the following in an engineering design notebook:

1) **Task Analysis** - analyze the mission/task to be performed
2) **Strategy and Design** - determine engineering design process, roles, theory of operation, design requirements, system design, crew resources, integration testing, and design updates
3) **Costs** - calculate costs and anticipated capabilities associated with design and operation, including modification of the design to further support a competitive and viable business case

You will need to work together as a team with coaches and mentors to identify what you need to learn while pursuing the completion of this challenge. By connecting your own experience and interest, you will have an opportunity to gain further insight into the application of design concepts, better understand application of Unmanned Aircraft System technology, and work collaboratively towards completion of a common goal.

**Challenge**

This year’s challenge is to design Unmanned Aircraft Systems (UAS), create a theory of operation, and develop a business plan for the commercial operations of the system based on the following scenario.

*Scenario*: Your Company has been contracted by a package delivery company to do a pilot program for aerial deliveries. The contracting company requires that your team carry packages that weigh up to 5 kg and have maximum dimensions of 0.5 m X 0.5 m X 0.25 m. Your team must deliver the packages from a Central Hub (location seen in a map in the Detailed Background) to locations in the city (also seen in the Detailed Background map). Your team will decide what delivery locations will be serviced with your Unmanned Aerial Vehicle(s) (UAV). Assume all of the packages are the maximum size and maximum weight listed above. Also assume that you will be delivering to the same locations each day. For this challenge, assume that the city has received the necessary waivers from the FAA to operate UAS in the...
city. In order to obtain the waivers, any UAS design must meet a set of safety requirements (outlined below) to operate within the city. The contracting delivery company will pay your team based on the number of delivered packages per day (a day is defined as a 12-hour period of daylight) over a 30-day period (your rate of pay per package is in the Detailed Background).

The Urban Environment: The pilot delivery program will be conducted over an 8 km by 8 km environment. A map of the urban environment is provided later in this section. The map includes zones of different population densities that include maximum package deliveries per day for each zone. As part of agreement with the contracting company and city, your team must design flight corridors for your delivery UAVs. All refueling/recharging and package pick up must occur at the Central Hub.

Delivery System: Teams must design an efficient and safe delivery system. All packages must be delivered to a designated 3 m by 3 m space at the delivery location. Teams may assume that the required 3 m by 3 m space will be available at the delivery location (part of the delivery agreement between the costumer and delivery company). Packages may be lowered from a hovering aircraft; or aircraft may land, release the package, and takeoff. Aircraft that land and takeoff must fit within the 3 m by 3 m space and all landing and takeoffs must be vertical. The delivery system must include auditory and visual cues to warn people that a delivery is in progress.

Safety: You should include ways of addressing any possible safety issues that might arise. At a minimum, you must address safety issues outlined under Requirements below.

Business case: Teams will be doing this year’s project as if they were contracted by a company to fly packages using an Unmanned Aircraft System (UAS). What that means is you will be paid based on the number of packages you deliver in the service area in a day (a day is defined as a 12-hour period of daylight). You will need to show that you are making money over a 30-day period from the fees you receive from deliveries (assume you are delivering the same number of packages each day). You need to show that you are making enough money to cover more than your operating costs (the cost of fuel and personnel). You should also show that you are able to cover your fixed costs over time (the cost of things like your UAV and other parts of your UAS) even if that occurs over a longer period than 30-days. Additional details on business details (e.g. the amount paid per package) are listed later in this document.

Approach
Each team is to operate from the perspective of a small company seeking funding for the demonstration of a prototype system. The challenge proposal should utilize the PACE model of product development (as advocated by the Product Development Management Association; www.pdma.org) such that the engineering development costs are minimized but also include information about the acquisition cost and operations and support cost of the system to show that the product can make a competitive bid for the contract and perform the mission effectively. The following steps are recommended in pursuit of a response to the challenge scenario:

1. Consider all aspects and requirements of the challenge
2. Perform background research on the topic, available tools, and existing designs
3. Review the provided information on the urban setting and delivery locations
4. Develop a theory of operation that can be adapted as you learn more about the challenge topics
5. Create an initial design (conceptual design)
6. Analyze the design and determine effectiveness (i.e., identify process[es] to validate and verify preliminary design and operation; ensure aircraft is capable of the limit load factor and ultimate load factor; determine delivery efficiency, airframe efficiency, airframe cost, and business profitability; redesign and revise as necessary)
7. Continue research and design (document detailed design, design decisions, lessons learned, recalculate variables; redesign and reanalyze, as necessary)

The successful proposal should include an estimate of the project budget, while striving to demonstrate and illustrate how the solution efficiently delivers packages.

It is strongly recommended that you conduct your own research on the topic to answer the following questions as you begin to develop your challenge solution:
- What sensors are required for safe flight?
- How will the package be delivered at the delivery site (hover and lower package, land, etc.)?
- How many UAVs would be appropriate to address the challenge?
- How will distance from the hub to delivery location affect your design?
- Will multiple UAV designs be necessary for different delivery locations?
- What are the unique advantages or limitations associated with the use of a UAS for package delivery?
- What benefits or capabilities of UAS can be enhanced or augmented to support their use?
- How are you addressing the mission requirements and how will the requirements affect your design?

From a business perspective, you may also want to consider the various operational factors and design capabilities that may affect the cost of package delivery.

**Map of the Urban Area**

Deliveries will be conducted over an 8 km by 8 km area. A map of the delivery area for this pilot program is provided in Figure 4. All unmanned aircraft must stay within the bounds of the designated area during deliveries. A larger version of the map is provided at the end of this document. Key aspects of the map are outlined below. Only relevant information to the pilot delivery program has been provided on the map. Assume that blank locations on the map still contain structures such as houses, commercial properties, other housing structures, industry buildings, parks, etc.
Figure 4. Map of the pilot delivery area.

**Small Squares**
Each small square outlined by green lines represents a 0.2 km by 0.2 km area. The green lines do not represent roads. These squares are provided to help clarify the map and to provide a scale.

**Hub**
The Central Hub is designated in red and is at the center of the provided map. All refueling/recharging and loading of packages must occur at the Central Hub.

**Roads**
Only major roads are shown on the map. These major roads are 1.6 km apart. You may assume that smaller roads do exist, but are just not shown on the map. Assume traffic on these major roads have a maximum speed of 90 km/hr.

**Delivery Neighborhoods**
Each delivery neighborhood that has agreed to participate in this pilot program is highlighted on the map as blue. The numbers in each area represent the maximum number of packages that can be delivered to each area per day. When designing an aircraft to deliver to a specific neighborhood, you must assume that the package is being delivered to the furthest square away from your closest flight corridor (more information on flight corridors is provided later in this section). As example, your company wants to deliver to the furthest to the left neighbor on the map. You have designated a flight
corridor that follows one of the major roads. As shown in Figure 5, your UAVS must deliver to the red dot, as it is the furthest square from the flight corridor (and hub).

Figure 5. Example delivery to a neighborhood.

If your UAS is capable of delivering more than one package on a single flight, you may assume that the next delivery location is one square over (0.2 km). This example is shown in Figure 6.
Figure 6. Example of two deliveries by the same UAS.

No Fly Zone
The pilot delivery area has one area that has been designated as a No Fly Zone. Your aircraft may fly around this area, but not through it. The No Fly Zone includes the road that intersects the area.

Buildings
The gray areas designate the city center with tall buildings (skyscrapers). The numbers provided with the areas designate the minimum height the UAS must fly to clear the buildings in each area. To reduce the effect of wind blowing between tall buildings (wind tunnel effect), it is recommended that aircraft fly at the minimum designated height when flying around the city center as well.

Flight Corridors
In order to increase safety, the city, where the pilot delivery program is occurring, has required that the aircraft fly in designated flight corridors when they are not in delivery neighborhoods. Using flight
corridors will help ensure that aircraft stay within known flight paths and should be easier to track. Design of the flight corridors should minimize hazards and nuisance to the city population. As stated earlier, the provided map does not show all city details. Blank areas on the map will still contain other structures such as houses, commercial properties, parks, etc. Citizens would prefer not to have multiple UAVs fly over their homes or place of business many times a day.

**Concept of Operations (CONOPS)**

A concept of operations is used by many different organizations and each has slightly different requirements. The basic purpose of a concept of operations is to describe the characteristics of a system from the viewpoint of a user of the system. It is used to communicate the characteristics to all stakeholders. For this challenge, the CONOPS will be used to explain the operation of your system through all phases of the mission. A CONOPS should be clear, concise, and easy to understand. You can describe the operation through paragraphs, lists, and figures.

The CONOPS section has multiple parts to consider.

**Pre-Mission**

Describe the characteristics of the system in the pre-mission up to and including the preparation of the delivery flight. You need to include information for the aircraft’s first flight of the day such as bringing the aircraft out from storage. The pre-mission occurs at the Central Hub. Some considerations for this section

- What steps are required to prepare the aircraft for flight? Examples include
  - Loading package
  - Checking correct fuel/charge
  - Programming flight path
  - Completing safety check of aircraft and environment
- Who performs each step in the preparation?
- Where do the steps take place? Is there a designated preparation area?
- Where is the takeoff/landing area for the aircraft (outside on ground level, on the roof, etc.)?
- How is the aircraft moved from preparation area to takeoff/landing area?

**Flight to Delivery Location**

Describe the characteristics of the system on its flight from the Central Hub to the delivery location. Some considerations for this section

- What communications are required during the flight? Between aircraft and controller(s)? Between aircraft?
- Provide details on flight within a flight corridor.
- Provide details on flight within a delivery neighborhood.
Package Delivery
Describe the characteristics of the system during package delivery. Some considerations for this section

- Describe how the package is delivered.
- What communication occurs during delivery?

Return Flight to Hub
Describe the characteristics of the system on its flight from the delivery location back to the Central Hub. Some considerations for this section

- What communications are required during the flight? Between aircraft and controller(s)? Between aircraft?
- Provide details on flight within a delivery neighborhood.
- Provide details on flight within a flight corridor.

Post-Mission
Describe the characteristics of the system when the aircraft returns from delivering a package. Include details on steps if the aircraft is prepared for another mission and if the aircraft is finished for the day. Some considerations for this section.

- How is the aircraft moved from landing area?
- How is the aircraft prepared for another mission?
- How is the aircraft stored at the end of the day?
- Who performs each task?
III. Mission Requirements
The requirements for the UAS are focused on the ability to fly safely in an urban environment around people. Your aircraft must meet all of the following requirements in order to be allowed to fly within the city. Other than these requirements, you are to assume that you are given any additional permission to flight outside of current regulations regarding unmanned systems.

Guidance without GPS
Aircraft flying in an urban environment cannot rely on GPS for accurate position or guidance information. “Urban Canyon” is a common phenomenon in cities. Aircraft must be able to accurately navigate the city when GPS signal is lost or if there is signal interference.

Obstacle Avoidance
The aircraft must be able to avoid all stationary and moving obstacles. Geofencing should be used for known fixed objects such as buildings. The aircraft must be able to detect and avoid moving objects or any other stationary objects not included in the geofencing. The aircraft must be able to stay at least 1 m from any obstacles.

Beyond Line of Sight
The aircraft must be able to operate beyond line of sight. The aircraft must be monitored during the entire flight, and the aircraft must have a system for a pilot to take control of the aircraft when needed.

Fuel/Charge Reserve
The aircraft must have a fuel/charge reserve that allows for an additional 20 min of flight beyond the required time to complete its mission. This additional reserve is to account for non-design conditions such as non-ideal atmospheric conditions and congestion at the Central Hub.

One Engine Out Condition
The aircraft must be able to continue safe and controllable flight if an engine fails. During aircraft design, assume that engine failure occurs while the aircraft is carrying the package. The aircraft must be able to use the remaining engines to either return to the Central Hub, deliver the package, or make a safe landing depending on your company’s protocols and aircraft location.

Emergency Landings
The aircraft must have a procedure to make an emergency landing in case of a failure on the aircraft or it encounters a scenario in which it does not know how to respond. The aircraft must try to find a location to land that minimizes damage to property and injury to people. The aircraft must provide visual and auditory cues to warn people during the landing. To protect property and people, propellers on fixed-wing aircraft must be foldable and not be spinning during landing. Rotors on rotorcraft must be enclosed so that the blade tip cannot strike any object.
Use of Multiple UAVs
If you decide to use multiple UAVs simultaneously, you must explain how you plan to safely manage the flight paths of all flying UAVs to insure there are no accidents. Detailed explanation will be needed on how you keep them from crashing into each other and how you will keep them far enough apart especially at the Central Hub.

FAA Regulations
Although your team is not required to meet the FAA regulations for flying unmanned systems, they are listed below. The regulations will provide a better understanding of the types of safety concerns that limit the flight of UAVs. The following information is meant as a reference. You are NOT required to follow any of the FAA Regulations. Instead, you are to follow the above regulations from the city. However, you do need to be familiar with the regulations as you are required to explain how your design fits within the current regulations.

Operational Limitations

• Unmanned aircraft must weigh less than 55 lbs. (25 kg).
• Visual line-of-sight (VLOS) only; the unmanned aircraft must remain within VLOS of the remote pilot in command and the person manipulating the flight controls of the small UAS. Alternatively, the unmanned aircraft must remain within VLOS of the visual observer.
• At all times the small unmanned aircraft must remain close enough to the remote pilot in command and the person manipulating the flight controls of the small UAS for those people to be capable of seeing the aircraft with vision unaided by any device other than corrective lenses.
• Small unmanned aircraft may not operate over any persons not directly participating in the operation, not under a covered structure, and not inside a covered stationary vehicle.
• Daylight-only operations, or civil twilight (30 minutes before official sunrise to 30 minutes after official sunset, local time) with appropriate anti-collision lighting.
• Must yield right of way to other aircraft.
• May use visual observer (VO) but not required.
• First-person view camera cannot satisfy “see-and-avoid” requirement but can be used as long as requirement is satisfied in other ways.
• Maximum groundspeed of 100 mph (87 knots).
• Maximum altitude of 400 feet above ground level (AGL) or, if higher than 400 feet AGL, remain within 400 feet of a structure.
• Minimum weather visibility of 3 miles from control station.
• Operations in Class B, C, D and E airspace are allowed with the required ATC permission.
• Operations in Class G airspace are allowed without ATC permission.
• No person may act as a remote pilot in command or VO for more than one unmanned aircraft operation at one time.
• No operations from a moving aircraft.
• No operations from a moving vehicle unless the operation is over a sparsely populated area.
• No careless or reckless operations.
• No carriage of hazardous materials.
• Requires preflight inspection by the remote pilot in command.
• A person may not operate a small unmanned aircraft if he or she knows or has reason to know of any physical or mental condition that would interfere with the safe operation of a small UAS.
• Foreign-registered small unmanned aircraft are allowed to operate under part 107 if they satisfy the requirements of part 375.
• External load operations are allowed if the object being carried by the unmanned aircraft is securely attached and does not adversely affect the flight characteristics or controllability of the aircraft.
• Transportation of property for compensation or hire allowed provided that
  o The aircraft, including its attached systems, payload and cargo weigh less than 55 pounds total;
  o The flight is conducted within visual line of sight and not from a moving vehicle or aircraft; and
  o The flight occurs wholly within the bounds of a State and does not involve transport between (1) Hawaii and another place in Hawaii through airspace outside Hawaii; (2) the District of Columbia and another place in the District of Columbia; or (3) a territory or possession of the United States and another place in the same territory or possession.
• Most of the restrictions discussed above are waivable if the applicant demonstrates that his or her operation can safely be conducted under the terms of a certificate of waiver.

**Remote Pilot in Command Certification and Responsibilities**

• Establishes a remote pilot in command position.
• A person operating a small UAS must either hold a remote pilot airman certificate with a small UAS rating or be under the direct supervision of a person who does hold a remote pilot certificate (remote pilot in command).
• To qualify for a remote pilot certificate, a person must:
  o Demonstrate aeronautical knowledge by either:
    ▪ Passing an initial aeronautical knowledge test at an FAA-approved knowledge testing center; or
    ▪ Hold a part 61 pilot certificate other than student pilot, complete a flight review within the previous 24 months, and complete a small UAS online training course provided by the FAA.
  o Be vetted by the Transportation Security Administration.
  o Be at least 16 years old.
• Part 61 pilot certificate holders may obtain a temporary remote pilot certificate immediately upon submission of their application for a permanent certificate. Other applicants will obtain a
temporary remote pilot certificate upon successful completion of TSA security vetting. The FAA anticipates that it will be able to issue a temporary remote pilot certificate within 10 business days after receiving a completed remote pilot certificate application.

- Until international standards are developed, foreign-certificated UAS pilots will be required to obtain an FAA-issued remote pilot certificate with a small UAS rating.

A remote pilot in command must:

- Make available to the FAA, upon request, the small UAS for inspection or testing, and any associated documents/records required to be kept under the rule.
- Report to the FAA within 10 days of any operation that results in at least serious injury, loss of consciousness, or property damage of at least $500.
- Conduct a preflight inspection, to include specific aircraft and control station systems checks, to ensure the small UAS is in a condition for safe operation.
- Ensure that the small unmanned aircraft complies with the existing registration requirements specified in § 91.203(a)(2).

A remote pilot in command may deviate from the requirements of this rule in response to an in-flight emergency.
IV. Payload Selection Guidelines and Catalog Options

There is a variety of payloads and capabilities that could be applied to satisfy the requirements of the challenge. This section describes several possible options that can be selected for incorporation into your design. It is suggested that each team also research other possible payloads that can be used. It is important that you consider payload attributes including cost, capacity, weight, power required, and capabilities (e.g., sensor resolution and field-of-view). In addition, you should consider how the payload you select will be integrated with your platform. Be sure to address size, weight, power, and stabilization requirements. The selection must consider environmental factors such as operating temperature ranges, humidity, and cooling method. An analysis of cost and integration of selected payloads must be included.

The UAS platform should be thought of as a deployment tool for the payload and should be optimized for optimal payload performance. RWDC has created the following payload options to be used as a reference in the design of the UAS system. Since technology is constantly advancing, especially for sensors, you are encouraged to explore what other options may be available, and make your own selections based on your analysis (please provide supporting rationale and at least the same level of detail as is provided here in the engineering notebook). Keep in mind you will need to obtain accurate costs for any non-catalog option payloads you incorporate.
Visual (Exteroceptive) Sensors
Visual exteroceptive sensors are used to capture information (e.g., visual data) regarding the remote operating environment to provide the operator with situational awareness relative to the orientation and location of the aerial vehicle element. Common payload sensors include CCD/CMOS cameras, thermal, LiDAR, SAR, and multispectral camera. It is suggested that each team also research other possible sensors that might fit better with their mission goals. It is important that you consider payload attributes including cost, capacity, weight, power required, and capabilities (e.g., sensor resolution and field-of-view). Make sure to consider the data treatment and post-processing requirements as part of the sensor selection criteria (e.g. sensor data on board processing vs. downlink requirements, post-flight data analysis requirements, and associated/required cost/manpower/time/equipment). In addition, you should consider how the sensor you select will be integrated with your platform. Be sure to address size, weight, power, and stabilization requirements. The selection must consider environmental factors such as operating temperature ranges, humidity, and cooling method. An analysis of cost and integration of selected payloads must be included.

RWDC has created the following sensor options to be used as a reference in the design of the UAS system. However, you are encouraged to explore what other options may be available, and make your own selections based on your analysis (please provide supporting rationale and at least the same level of detail as is provided here in the engineering notebook). Keep in mind you will need to obtain accurate costs for any non-catalog option payloads you incorporate.

- Power Draw: 5.6 W (nominal), 8 W (maximum)
It is important to consider sensor capabilities when selecting your platform and proposed mission plans. For example, increases in altitude will increase the area collected by the sensor in a given period but it will also reduce the resolution or the detail collected (see Figure 7).

Figure 7. As the altitude of the UAS changes, the sensor footprint will vary.

You should also consider the speed at which the sensor collects images, the velocity and altitude of the platform, and the layout of the collection flights to ensure there are no data holidays or gaps in collected data over the surface of the area of interest (see following figures).
Figure 8. The overlapping sensor footprints must sufficiently overlap for sensing without gaps or data holidays.

Figure 9. The overlapping sensor footprints must sufficiently overlap for detection during a coordinated turn at the inside of the turn and the outside of the turn to ensure complete coverage and no data holidays.
Figure 10 depicts the flight path of a UAS over a hypothetical field. Note that the flight paths follow a straight line until passing the edge of the collection area. These paths should be spaces to ensure that both the end-lap (the overlap of collected images along a single flight line) and the side-lap (the overlap of collected images in neighboring parallel flight lines) are sufficient to ensure complete area coverage with no gaps. Also note that the distance that the UAS must actually travel is longer than simply flying over the collection area. Again, remember the design of your system is the act of balancing the competing requirements of the sensor and platform to meet the mission needs.

Figure 10. Example of an assembled coverage area from pre-calculated flight maneuvers and their individual coverage areas.
V. Air Vehicle Element Selection Guidelines and Catalog Options

Your selection of Air Vehicle Element(s) and associated subsystem components will be primarily directed by the type of application or task to be performed and the payload to be carried. It is suggested that before starting the design process you fully examine the requirements of the application/task and determine an overview theory of operation (i.e., how you expect an overall design to work in relation to application planning, briefing, launch, execution, recovery, and debrief). Consider the following:

1) What operational speed, duration, and range would best support this challenge scenario?
2) What type of flight operation would best suite your approach?
   • Forward flight
     o Fixed-wing (fast to slow speeds, best power economy/performance with a payload)
     o Hybrid (fast to slow speeds, improved power economy with a payload)
     o Rotary-wing (medium to slow speeds, reduced power economy with a payload)
     o Multirotor (slow speeds, least power economy with a payload)
   • Translational (i.e., transition from hover to forward, lateral, or reverse) and hovering flight
     o Rotary-wing (medium to slow speeds, most vertical lifting potential)
     o Hybrid (fast to slow speeds, medium lifting potential)
     o Multirotor (slow speeds, least vertical lifting potential)
3) What performance would you be willing to trade for additional capability?
   a. None-only forward flight and payload capability is important (fixed-wing)
   b. Some duration/payload lift capability – high speed forward flight, ability to take off in small space, and ability to hover is important (hybrid or rotary-wing)
   c. Fast forward flight and duration – ability to take off in small space, stopping to hover often, and low cost is important (multirotor)

You are provided with the following baseline air vehicle element options for this challenge:
   • Fixed-wing Pusher Propeller
   • Fixed-wing Tractor Propeller
   • Rotary-wing/helicopter
   • Multirotor
   • Hybrid (fixed-wing/quadrotor)

This catalog of Air Vehicle Element options was created as a starting point for the design of your UAS. You are free to modify or change each of these options as you deem necessary, or you can start from scratch (provide supporting rationale and at least the same level of detail as is provided here in the engineering notebook). Keep in mind, you will need to calculate costs to modify the airframes as purchased or build from scratch (e.g., materials, labor, and components). You will also need to determine all of the metrics identified for each example airframe in their respective detailed descriptions below.
The following subsections contain the details for the baseline Air Vehicle Element configurations. Please note that additional options for the Air Vehicle Element are available in the Alternative Air Vehicle Element Options section.

**NOTE:** It is essential that you compare all of the features, capabilities, and limitations of each option and not select based solely on price. Your success in this project will be dependent on providing rational justifying your selections including the following:

- Ability to lift selected payload(s)
- Capability to capture sensor data from the entire subject area (i.e., sufficient range to cover crop using your identified method)
- Sufficient flight duration capability to cover applicable subject area
- Establishment/maintenance of safe operation (e.g., continual visual tracking, minimizing potential for aircraft loss or accident, and continuity of communications)
- Ensuring sufficient personnel to support proposed operations
- Cost to integrate design (i.e., engineering development effort) and operate the system as proposed
Option A: Fixed-Wing Pusher Propeller Design

Figure 11. Fixed-wing pusher propeller design.

Airframe:
- Composite airframe
- V-tail (mixed rudder/elevator)
- High-mounted wing with ailerons
- Tricycle landing gear

Flight Controls
- Push-pull connectors
- Servos:
  - (2) ailerons
  - (2) mixed-elevator/rudder (v-tail)
  - (1) steerable nose gear
- Electronic speed control (ESC, less than 100A)
- Universal Battery elimination circuitry (BEC)

Powerplant (propulsion)
- Electric Brushless Motor (7.7;1 geared drive)
  - Weight: 22.4 oz
  - Dimensions: 2.5” (diameter) x 2.4” (case length), 8mm diameter shaft (.98” length)
  - RPM/V (kV Rating): 250
  - Input Voltage: 44.4 V
  - Motor static efficiency: 62.8%
  - Supplied power: 2.68 hp (1998 W)
  - Static thrust: 15.24 lb (with 19 x 11 propeller static RPM of 5650)
  - Max constant current: 45 A
- Max surge current: 72 A
- Max constant Watts: 2500 W
- Propeller (pusher, 19 x 11, efficiency 80%)
- Battery (640 Wh 44.4 V, Lithium Polymer [Li-Po])

**Onboard Sensors**
- None

**Metrics**
- Cost: $15,000.00
- Empty Weight: 32.85 lb (14.9 kg)
- Wing span: 129” (3.3 m)
- Length: 89.37” (2.27 m)
- Maximum payload: 14.55 lb (6.6 kg)
- Endurance: 110 minutes with 6.17 lb (2.8 kg) payload
- Cruise speed: 42.76 kt (49.21 mph)

**Required Equipment/Components**
- Autopilot and/or servo control (i.e., primary and secondary control; e.g., servo receivers [RX]s or serial servo controllers)
- Sensor (payload)
- Onboard sensors
- Antennas (primary and secondary control, telemetry, and video)
- Ground control and communications (primary and secondary)
Option B: Fixed-Wing Tractor Propeller Design

Figure 12. Fixed-wing tractor propeller design.

Airframe:
- Reinforced carbon fiber airframe
- Fiberglass payload bay module
- Conventional tail (elevator and rudder)
- High-mounted wing with ailerons

Flight Controls
- Servos:
  - (2) ailerons
  - (1) rudder
  - (1) elevator
- Push-pull connectors
- ESC
- Independent 1300 mAh Li-Po battery (for servo power)

Powerplant (propulsion)
- Electric motor (brushless)
  - Weight: 2.6 oz
  - Dimensions: 1.1” (diameter) x 1.47” (case length), 4 mm diameter shaft
  - RPM/V (kV Rating): 880
  - Input Voltage: 7.4 V
  - Motor static efficiency: 65.4%
  - Supplied power: 0.19 hp
  - Static thrust: .99 lb (with 10 x 6 propeller static RPM of 5150)
  - Max constant current: 20 A
  - Max surge current: 25 A
  - Max constant Watts: 189 W
- (2) 5000 mAh Li-Po batteries (for motor)
- Propeller (folding tractor, 10 x 6, efficiency 78%)
**Onboard Sensors**
- None

**Metrics**
- Cost: $5,000.00
- Empty Weight: 2.78 lb (1.26 kg)
- Wing span: 78.74” (2.0 m)
- Length: 47.24” (1.2 m)
- Maximum payload: 0.88 lb/14.12 oz (0.4 kg)
- Endurance: 55 minutes with 0.88 lb/14.12 oz (0.4 kg) payload
- Cruise speed: 32.39 kt (37.28 mph)

**Required Equipment/Components**
- Autopilot and/or servo control (i.e., primary and secondary control; e.g., servo receivers [RX]s or serial servo controllers)
- Sensor (payload)
- Onboard sensors
- Antennas (primary and secondary control, telemetry, and video)
- Ground control and communications (primary and secondary)
Option C: Rotary-wing Design

![Rotary-wing design](image)

**Airframe:**
- Plastic and aluminum

**Flight Controls**
- 120 degree collective/cyclic pitch mixing system (CCPM)
- Single main rotor (810 mm symmetrical v-blade rotors)
- Tail rotor (130 mm)
- Servos:
  - (1) engine throttle
  - (1) rotor pitch
  - (1) rotor roll
  - (1) rotor collective
  - (1) yaw (tail rotor)
  - (1) Gyroscope mode selection

**Powerplant (propulsion)**
- 52CC two-stroke, two-cylinder, internal combustion engine (8hp; Zenoah G-26 engine)
  - Weight: 50 oz (w/o muffler), 57 oz (with muffler)
  - Dimensions: 6.6” (L) x 8” (W) x 7.7” (H)
  - Fuel Consumption: 14.22 fl-oz/hp/hr
  - Supplied power: 8 hp (5965 W)
  - Static thrust: 40 lb
  - Single carburetor manifold
- Engine cooling fan
- Rotor (810 mm, efficiency: 90%)
- Fuel: gasoline mixed with two-cycle engine oil
• Fuel tank: 32 oz capacity
• Battery (servo power): 3000 mAh 6.0 V

**Onboard Sensors**
• Gyroscope

**Metrics**
• Cost: $8,000
• Empty Weight: 20 lb (9.07 kg)
• Main rotor diameter: 63.78” (1.62 m)
• Tail rotor diameter: 10.63” (0.27 m)
• Length (including rotors): 78.74” (2 m)
• Width: 20.87” (0.53 m)
• Height: 25.98” (0.66 m)
• Maximum payload: 25 lb (11.34 kg)
• Endurance: 30 minutes without payload (32 oz fuel)
• Cruise speed: 21.6 kt (24.85 mph)

**Required Equipment/Components**
• Autopilot and/or servo control (i.e., primary and secondary control; e.g., servo receivers [RX]s or serial servo controllers)
• Sensor (payload)
• Onboard sensors
• Antennas (primary and secondary control, telemetry, and video)
• Ground control and communications (primary and secondary)
Option D: Multirotor Design

![Figure 14. Multirotor design.](image)

**Airframe:**
- Plastic and aluminum
- Includes structure to attach/hold payload (i.e., camera)

**Flight Controls**
- Multirotor flight controller with autopilot functionality (e.g., Wookong-M)
  - GPS positioning, attitude hold, and heading hold
  - Modes of operation: Manual, attitude, and GPS attitude
  - Fail safe hover
  - Go home and auto landing
- ESC (6 units, 40 A)

**Powerplant (propulsion)**
- Electric Brushless Motor (6 engines, 41 x 14 mm, 320 rpm/V, 360 W maximum power)
  - Weight (each): 5.22 oz
  - Dimensions: 1.8” (diameter) x 1.26” (case length), 4 mm diameter shaft
  - RPM/V (kV Rating): 320
  - Input Voltage: 22.2 V
  - Motor static efficiency: 77.3%
  - Supplied power: 0.6 hp
  - Static thrust: 3.35 lb (with 15 x 4 propeller static RPM of 6235)
  - Max constant current: 30 A
  - Max surge current: 35 A
  - Max constant Watts: 360 W
- 6S 10,000 mAh, 15 C, 22.2 V LiPo battery
- (6) Propellers (carbon fiber, 15 x 4, efficiency 85%)
  - (3) clockwise rotation
  - (3) counter-clockwise rotation
**Onboard Sensors**
- GPS
- Inertial measurement unit (IMU) built into flight controller
  - (3) gyroscopes
  - (3) accelerometers
  - (3) magnetometer

**Metrics**
- Cost: $6,000
- Empty Weight: 15.43 lb (7 kg)
- Diagonal span: 31.50” (0.80 m)
- Frame arm length: 13.78” (0.35 m)
- Length (including rotors): 47.46” (1.18 m)
- Length (including rotors): 39.37” (1.00 m)
- Height: 19.69” (0.50 m)
- Payload (supports up to): 5.51 lb (2.50 kg)
- Endurance: 16 minutes
- Maximum ascent/descent speed: 3 m/s
- Maximum flight speed: 10 m/s or 19.44 kt (22.37 mph)

**Required Equipment/Components**
- Secondary servo control (e.g., servo receiver [RX] or serial servo controller)
- Sensor (payload)
- Additional onboard sensors
- Antennas (primary and secondary control, telemetry, and video)
- Ground control and communications (primary and secondary)
Option E: Hybrid (Fixed-wing/Quadrotor) Design

Figure 15. Hybrid (fixed-wing/quadrotor) design.

**Airframe:**
- Composite materials

**Flight Controls**
- Quadrotor
  - Multirotor flight controller with autopilot functionality (e.g., Wookong-M)
    - GPS positioning, attitude hold, and heading hold
    - Modes of operation: Manual, attitude, and GPS attitude
    - Fail safe hover
    - Go home and auto landing
  - ESC (4 units, 40 A)
- Fixed-wing
  - Servos:
    - (2) ailerons
    - (1) rudder
    - (1) elevator
  - Push-pull connectors
  - (1) ESC

**Powerplant (propulsion)**
- Fixed-wing:
  - Electric Brushless Motor (7.7;1 geared drive, 2700 W, 2.7 kV)
    - Weight: 22.4 oz
    - Dimensions: 2.5” (diameter) x 2.4” (case length), 8 mm diameter shaft (0.98” length)
    - RPM/V (kV Rating): 250
    - Input Voltage: 44.4 V
    - Motor static efficiency: 62.8%
    - Supplied power: 2.68 hp (1998 W)
    - Static thrust: 15.24 lb (with 19 x 11 propeller static RPM of 5650)
- Max constant current: 45 A
- Max surge current: 72 A
- Max constant Watts: 2500 W
  - Propeller (pusher, 19 x 11, efficiency 80%)
  - Battery (640 Wh 44.4 V, Lithium Polymer [Li-Po])
- Secondary (quadrotor):
  - Electric Brushless Motor (4 engines, 41 x 14 mm, 320 rpm/v, 360 W maximum power)
    - Weight (each): 5.22 oz
    - Dimensions: 1.8” (diameter) x 1.26” (case length), 4 mm diameter shaft
    - RPM/V (kV Rating): 320
    - Input Voltage: 22.2 V
    - Motor static efficiency: 77.3%
    - Supplied power: 0.6 hp
    - Static thrust: 3.35 lb (with 15 x 4 propeller static RPM of 6235)
    - Max constant current: 30 A
    - Max surge current: 35 A
    - Max constant Watts: 360 W
  - 6S 10,000 mAh, 15 C, 22.2 V LiPo battery
  - (4) Propellers (carbon fiber, 15 x 4, efficiency 85%)
    - (2) clockwise rotation
    - (2) counter-clockwise rotation

**Onboard Sensors**
- GPS
- IMU built into flight controller
  - (3) gyroscopes
  - (3) accelerometers
  - (3) magnetometer

**Metrics**
- Cost: $25,000
- Empty Weight: 25 lb (11.34 kg)
- Wing span: 127.95” (3.25 m)
- Length: 88.58” (2.25 m)
- Maximum payload: 5 lb (2.27 kg)
- Endurance (forward flight): 60 minutes with 5 lb (2.27 kg) payload
- Endurance (hover): 5 minutes with 5 lb (2.27 kg) payload
- Cruise speed: 35 kt (40.28 mph)

**Required Equipment/Components**
- Fixed-wing flight controls: Autopilot and/or servo control (i.e., primary and secondary control; e.g., servo receivers [RX]s or serial servo controllers)
- Quadrotor flight controls: Secondary servo control (e.g., servo receiver [RX] or serial servo controller)
- Sensor (payload)
- Onboard sensors
- Antennas (primary and secondary control, telemetry, and video)
- Ground control (primary and secondary)
Alternative Air Vehicle Element Options

In addition to selecting and adapting the baseline catalog options, you are encouraged to explore other COTS unmanned aircraft (UAVs) to consider as suitable platforms to meet this challenge. The following subsections are provided to serve as a starting point of examples as you begin to research such aircraft platforms.

**Group 1 UAS**
This category consists of small UAS (sUAS) that weigh less than 20 lb, operate under 1200 ft AGL, and do not exceed an airspeed of 100 kt:

**Fixed-wing examples**
- Trimble
  - UX5
  - Gatewing X100
- AeroVironment
  - Wasp
- MarcusUAV Inc
  - Zephyr2
- UAVER
  - Avian
- Flite Evolution
  - FE 1800S Aerobot
- senseFly
  - Swinglet Cam
- Aeromao
  - Aeromapper
- CropCam
  - CropCam UAV
- Lockheed Martin
  - Desert Hawk III
- Trigger Composites
  - Pteryx
- L3
  - Cutlass
- Innocon
  - MicroFalcon LP
  - Spider
- C-ASTRAL Aerospace
  - Bramor gEO
  - Bramor C4EYE
- Survey Copter
  - Tracker120
- Airelectronics
  - Skywalker
- Mavinci
  - SIRIUS
- IDETEC Unmanned Systems
  - Stardust
- ARA
  - Nighthawk
- EMT
  - Aladin
- Lehmann Aviation
  - LM450
  - LM960
  - GoPro Personal UAV (LA100)
- Raphael
  - Skylite B (Patrol)
- Trigger Composites
  - EasyMap
- IAI
  - Bird Eye 400
  - Mosquito

**Group 2 UAS**
This category consists of sUAS that weigh between 21 to 55 lb, operate under 3500 ft AGL, and do not exceed an airspeed of 250 kt:

**Fixed-wing examples**
- Silent Falcon UAS Technologies
  - Silent Falcon
- AAI Corporation
- **Boeing/Insitu**
  - ScanEagle
- **Aeronautics**
  - Orbiter 3 STUAS
  - Orbiter 2 Mini UAS
- **Innocon**
  - MicroFalcon LE
- **Survey Copter**
  - DVF 2000
- **IAI**
  - Bird Eye 650
  - Mini Panther
- **UAV Factory**
  - Penguin BE
  - Penguin B
  - Penguin C
- **ELI Ltd**
  - Swan III
- **UMS Group**
  - F-330
- **UAVSI/Universal Target Systems Ltd**
  - Vigilant
- **ROVAerospace**
  - ROV-4 (Electric)
  - ROV-4 (Internal Combustion)
- **Advanced Ceramics Research**
  - Silver Fox
Additional Air Vehicle Element - Component Options
The following represent additional component options to improve or modify the Air Vehicle Element. You are free to select any of these options or locate similar ones that you deem necessary (please provide supporting rationale and at least the same level of detail as is provided here in the engineering notebook).

Flight Controls
The options identified in the following table can be used to improve the redundancy or performance of the flight control system.

Table 1. Air Vehicle Element – Additional Flight Control Options

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
<th>Cost Per Item</th>
</tr>
</thead>
</table>
| Universal battery-elimination circuitry (U-BEC) | This option represents an alternative power regulation module for protection of the control system. It provides power to the servo controls, without requiring an addition power source (i.e., uses main battery for power). When the available power for the system has diminished to no longer sustain powered/motored flight, the system will shift power solely to the flight controls (i.e., servos) to enable to the operator to perform a controlled descent (e.g., glide or autorotation). Use of a U-BEC instead of a built-in BEC (part of ESC) prevents grounding or over temperature malfunction conditions that could lead to loss of all power in the system. The details of this option include the following:  
  - Configurable 5 V or 6 V power  
  - Power required at 5.5 V to 23 V  
  - 1.63” (L) x .65” (W) x .28” (H)  
  - 0.26 oz | $20          |

## Component Description Cost Per Item

### Autopilot
Device onboard the UAV, autonomously controls servos/actuators, can be switched ON/OFF or dynamically reprogrammed with uploaded parameters from GCS. The details of this option include the following:

- Includes 6-DOF IMU (3-axis gyroscopes and accelerometers), digital compass, and barometer
- Connects in-line between an existing servo control (e.g., serial servo controller, microcontroller, or servo RX) and servos/ESCs
- Requires 5 to 6V power
- 0.81 oz
- 2.63” (L) x 1.6” (W) x .26” (H)
- Requires use of customizable/re-configurable software (e.g., APM Autopilot Suite: [http://ardupilot.com/?utm_source=Store&utm_medium=navigation&utm_campaign=Click+from+Store](http://ardupilot.com/?utm_source=Store&utm_medium=navigation&utm_campaign=Click+from+Store))

$250

### Multiplexer
This option provides an interface that can be used to switch control of up to seven (7) servos or ESC from two independent control sources (e.g., servo RX or servo controller). The details of this option include the following:

- Master controller (input A) determines control order (i.e., which input has control), unless signal loss is detected (then input B controls servos until input A connection restored).
  - The master controller must have an eighth (8) channel available to serve as a switch
  - Replaces buddy-box configurations of hobby radios
- 4.8 to 6 V power required
- 1.69” (L) x .7” (W) x .25” (H)
- 0.53 oz

$25

### Onboard Sensor Options
The following options can be used to obtain data pertaining to either the operating environment (e.g., exteroceptive) or the state of the Air Vehicle Element (e.g., proprioceptive). The following table is subdivided into analog sensors, digital sensors, complex sensors, and sensor capture, interpretation, and logging options.
Table 2. Air Vehicle Element – Additional Onboard Sensor Options

Complex Sensors

NOTE: The following are examples of sensors that require complex interface such as transistor-transistor logic [TTL] serial or multiple forms of interfacing (e.g., analog, digital, or combination). Use of these options requires the use of either a microcontroller to interpret the data (via TTL interface) or a dedicated data radio to send data to the ground control station for interpretation (also via TTL interface). If a radio is selected as the interface method, one radio per sensor would be required (be aware of frequency mapping considerations).

9-Degree of freedom (DOF) Inertial measurement unit (IMU) $40

A device used to measure the velocity, orientation, and gravitational forces. This option is a primary component of an inertial navigation system that is typically used to provide data to an autopilot or ground control station. The details of this option include the following:

- 3-axis gyroscope (one 16-bit reading per axis; reconfigurable to a +/-250, 500, or 2000 degree per second range)
- 3-axis accelerometer (one 12-bit reading per axis; reconfigurable to a +/-2, 4, 8, or 16 g range)
- 3-axis magnetometer (one 12-bit reading per axis; reconfigurable to a +/-1.3, 1.9, 2.5, 4.0, 4.7, 5.6, or 8.1 gauss range)
- Requires 2.5 to 5.5 V power
- 0.02 oz
- 0.8” (L) x 0.5” (H) x 0.1” (H)
- Interface(s)
  - A transistor-transistor logic (TTL) serial interface to microcontroller can be implemented as a single connection to report data from all sensor elements simultaneously
  - [or] Each constituent sensor element (e.g., each gyroscope axis, accelerometer axis, and magnetometer axis) can be connected to microcontroller analog inputs (requires nine [9] analog input connections)

- NOTE: This sensor is not compatible with option A-Onscreen Display (OSD) and Datalogger with Limited Telemetry Reporting
Global Positioning System (GPS) Sensor

Device that receives GPS signals to determine position on the Earth. The details of this option include the following:

- Provides latitude, longitude and altitude
- Receives GPS signals/data on up to 66 channels
- Outputs data in more than six (6) different National Marine Electronics Association (NMEA) GPS sentences to a TTL-level serial port
- 10 Hz update rate
- Requires 3 to 4.2 V power
- Red LED to indicate GPS fix or no fix conditions
- Capable of satellite-based augmentation system (SBAS) or Quasi-Zenith Satellite System (QZSS)
  - Wide area augmentation system (WAAS)
  - European geostationary Navigation Overlay Service (EGNOS)
  - Multi-functional Satellite Augmentation System (MSAS)
  - GPS and Geo Augmented Navigation (GAGAN)
- Integrated ceramic antenna
- Can acquire a fix from cold start within 32 seconds (acquires with hot-start in one [1] second)
- Requires TTL serial interface to microcontroller

**NOTE:** Use of this option requires the use of either a microcontroller to interpret the data (via TTL interface) or a dedicated data radio to send data to the ground control station for interpretation (also via TTL interface).
Sensor Capture, Interpretation, and Logging Options

Onscreen Display (OSD) and Datalogger with Limited Telemetry Reporting

Low-fidelity telemetry/onboard sensing option that can be connected to a video module to display the onboard sensor data on the visual first person view (FPV) camera feed from the Air Vehicle Element. It provides the capability to record the data locally (i.e. data log) for review in post process (i.e., after flight) or to overlay it on the FPV video feed from a CCD/CMOS camera on the aircraft. The details of this option include the following:

- **NOTE:** An FPV camera and associated transmitter(onboard)/receiver (on ground) combination MUST be used if this option is selected
- **OSD** – provides real time aircraft sensor data over existing video link
  - 0.5 oz
  - 0.5” (W) x 1” (L) x 0.25” (H)
  - 7 to 14 V power required
- **Data logger** – to record and store the sensor data for later review (i.e. post process; requires use of a PC)
  - 0.8 oz
  - 0.75” (W) x 1” (L) x 0.25” (H)
  - 7 to 14 V power required
  - Adjustable logging rate (50 samples per second to one every five minutes)
    - Power readings (current, voltage, milliamp-hours, wattage)
    - Signal strength reading (received signal strength indication [RSSI])
- **GPS** (position, altitude, speed, arrow to starting location, distance from starting location)
  - 0.4 oz
  - 0.5” (W) x 0.5” (L) x 0.25” (H)

**Cost:** $250
Microcontroller

High-fidelity/onboard sensing option that can be connected to a communication device (i.e., telemetry radio) using a serial interface to transmit analog and digital sensor data to a PC. The details of this option include the following:

- High-fidelity telemetry capture, logging, and reporting
- **NOTE:** If this option is to be used to gather live telemetry from the Air Vehicle Element it **REQUIRES** the use of a data/telemetry transceiver
- Limited by the availability of inputs/outputs (i.e., analog or digital)
  - 12 analog (these inputs can also be configured to provide control of up to 12 hobby servos or ESCs)
  - 6 digital (0 to 5 V)
- 1.8” (L) x 1.10” (W) x 0.40” (H)
- 0.35 oz
- 5 to 16 V power required
- Multiple interfaces available for connection with a PC
  - USB – Direct connection for debugging, tethered control, or data transfer (e.g., sensor data)
  - TTL adapter/Serial (RS-232) – Direct or remote (using transceiver) connection for debugging, tethered or remote control, or data transfer
- **Must use software application to control servos, read sensor data, and display data**
- **Must map out the following:**
  - Analog sensor inputs/outputs (i.e., identify the connection type and function of each port)
  - Digital sensor inputs
  - User control inputs from PC (e.g., joystick axis, joystick button, or control on application to servo movement)

$100

**Propulsion**

The propulsion systems for small aircraft are either internal combustion engines or electric motors. Glow fuel or gasoline are the common fuel sources for internal combustion engines with two- and four-stroke varieties available. There are many manufacturers of small aircraft engines. A few of them are listed below.

- O.S. Engines
- Saito Engines
Electric motors are either brushless or brushed, but brushless motors are typically more often used with small aircraft. There are many manufacturers of brushless motors. A few of them are listed below.

- AXi
- E-flite
- Hacker
- Jeti
- Neu

The required power from the propulsion system will be based on the size of the aircraft. For fixed-wing aircraft, the propulsion system is designed to provide the thrust required to counter the drag. Excess thrust is needed to allow the airplane to accelerate and climb. For rotorcraft, the propulsion system provides the lift in order to keep the aircraft in the air. Online hobby stores for RC aircraft are a great source of information on pricing of the different propulsion systems. The hobby stores are also a good resource to determine the typical size of propulsion systems used on aircraft of different weights. Numerous online hobby stores exist. Two large hobby sites are provided below

- Horizon Hobby (https://www.horizonhobby.com)
- Tower Hobbies (http://www.towerhobbies.com)
VI. Command, Control, and Communications (C3) Selection Guidelines and Catalog

While your team reviews your current theory of operation (that you defined based on guidance in section VI. Air Vehicle Element Selection Guidelines and Catalog Options), think about how you plan to interacting with your system. Consider the following questions:

- Will you rely on the majority of your flight operations being controlled autonomously with parameters being uploaded to an onboard autopilot or will you use a mix of autonomy and manual flight control (i.e., semi-autonomy) to purposefully deviate from a pre-established flight plan to move to specific areas?
- Do you plan on manually flying the aircraft using an egocentric/first person view? How will you obtain the visual from the aircraft?
- How will you incorporate secondary control to improve safety of the system? Will you use a hobby grade radio or a second GCS?
- Will you need to map controls to user input devices such as a USB joystick or handheld hobby radio?
  - Elevator (pitch) control – Joystick Y-axis
  - Ailerons (roll) control – Joystick X-axis
  - Rudder (yaw) control – Joystick Z-axis
  - Throttle (engine RPM) control – Joystick Rz
- How do you plan to display the visual and telemetry data coming back from your UAV? Here are some examples to consider:
  - Display the FPV camera feed on both a set of goggles (pilot) and a secondary LCD screen for others on the team to observe
  - Overlay the telemetry data on the OSD and depict on the GCS laptop
  - Display the telemetry data on a dedicated LCD screen
- Will you have to contend with any visual line of sight obstructions in the area you will be flying? How will you ensure you maintain communications?
- What is the maximum range for the communications signal you will need to establish and maintain?

Carefully consider all of the user interactions and communication that will be necessary to support your proposed theory of operation for this challenge scenario. As with previous sections you are free to modify or change each of these options as you deem necessary (please provide supporting rationale and at least the same level of detail as is provided here in the engineering notebook). Keep in mind you will need to determine accurate costs to purchase and integrate the components. The following represent the control processing, display, and communications options associated with C3.
Table 3. C3 Element – Control/Data Processing and Display Equipment Options

<table>

</tbody>
</table>
Tablet/Phone Control: A portable system that can be used to control the Air Vehicle Element (UAV). The details of this option include the following:

- **Airborne controller** - onboard the UAV, receives control commands from and relays onboard sensor data to the GCS (e.g., pairing of serial servo controller and data transceiver).
  - Serial servo controller is limited to mono-directional communication (control data from GCS to UAV)
  - Microcontroller requires bi-directional communication (control data from GCS to UAV, telemetry data from UAV to GCS)
  - **NOTE:** Use of this option requires selection of an Autopilot, Serial Servo Controller or Microcontroller under Air Vehicle Element - Additional Air Vehicle Element - Component Options (Table 1 and Table 2) and a Data Transceiver from Table 4.

- **Ground-based controller** – Tablet or Phone – serves as GCS system for capture of user input (control commands), capture and interpretation of telemetry data, and display of vehicle state. **NOTE:** Requires a Data Transceiver from Table 4.
  - Touchscreen display (inappropriate for manual control mode)
  - Android or iOS operating system
  - 64GB internal memory

This system is appropriate for autonomous operations (no additional GCS side components necessary) or semi-autonomous (when combined with manual control system).

**Antenna Options**

**NOTE:** The following options are appropriate for extending the range of the Data/Telemetry Communication options or the Video/Sensor Communication options. However, it is essential that the appropriate frequency type be matched (i.e., 900 Mhz antenna with 900 MHz TX or RX), otherwise the antenna, RX, and TX will not work correctly. The following calculator can be used to calculate wireless communication ranges (and anticipated increases through use of differing antennae):

</tbody>
</table>
Component | Description | Cost Per Item
--- | --- | ---
Power Generator – Heavy | Device used to generate power. The details of this option include the following:  
- Produces 4,000 W (33.3/16.7 A) maximum, 3,500 W (29.21/14.6 A) rated  
- 120/240 V output  
- Weight: 155 lb  
- Noise Level: 72 dB(a) @ rated load (1,600 W)  
- Runtime per tank (6.3 gallons): 9.4 hr @ rated load (3,500 W), 15.7 hr @ ½ load  
- Empty weight: 155 lb  
- Does NOT includes power inverter (unsafe for PC equipment without line conditioner)  
- 270 cc engine displacement | $1,800

Line Conditioner | Device that conditions power for use with sensitive electronics (i.e., protects from brownouts and overvoltages). The details of this option include the following:  
- 15 A circuit breaker  
- 1200 W output rating  
- EMI/RFI line noise filtering  
- 120 VAC, 10 A, 60 Hz  
- Four (4) power outlets  
- 2.09 lb  
- **NOTE:** *If the Power Generator – Heavy option is selected to power GCS equipment, this component will be necessary.* | $100
VIII. UAS Personnel/Labor Guidelines

The costs of the system are not solely measured in terms of the cost to purchase individual components, but are also reflective of the cost to operate and maintain the system, once it has been completed. The following subsections provide the details for both of these personnel and labor areas. When documenting design, consider your own hours spent performing tasks in support of each of these roles. Use your own experience and observations, coupled with research regarding typical time to perform such activities and guidance from your industry mentors to identify estimated efforts required to perform necessary actions to compile, deliver, and test an equivalent design. Use this experience to better understand what roles would be required, at a minimum, to create your design from conception to final delivery.

Operational and Support Personnel

Any UAS performing remote sensing require a variety of roles to be fulfilled by personnel on the ground in order to ensure safe and successful application execution. Different aircraft and application types will require different roles and therefore different numbers of ground support personnel. For the purposes of this competition a basic minimum ground personnel configuration can be assumed. Personnel should be assumed to work the entire 12-hour day unless their role specifically allows them to finish early. For example you need to keep paying someone who is part of your ground crew prepping flights even during the down time that they have to remain on site. Deviations are permitted, but must be justified with supporting rationale. The typical roles are outlined as follows:

NOTE: Full-time Equivalent (FTE) is used to indicate one person assigned full-time to the designated role. For this competition, fractional FTEs will not be allowed. For operational cost calculation purposes, fractions of an hour should be rounded up to the next highest integer. Costs are not dependent on individual salaries, but are instead tied to the value a company assigns to the role when their services are quantified and passed onto an external customer.

1) **Payload Operator** [$35/hr. fully loaded cost per 1.0 FTE]: This person is required when payload data is telemetered from the aircraft or requires manual operation during task execution. This person will typically sit at a ground station interacting with a graphical user interface (GUI) for the purpose of controlling the payload operations in real-time. For delivering a package, this will involve monitoring the flight status and data telemetry from the aircraft, steering the payload (i.e. directing where the package is being delivered), and directing the aircraft operator where to fly the aircraft during the package drop-off. The exact nature of this role will be driven by the method used for dropping off the package. The position is required for drop-offs not involving landing the aircraft. The payload operator may also be used for reloading packages when the aircraft lands at the central hub; however, you must show that they are not reloading an aircraft at the same time they are doing a drop-off.

2) **Range Safety/Aircraft Launch & Recovery/Maintenance** [$35/hr. fully loaded cost per 1.0 FTE]: This individual can be assigned multiple non-concurrent roles, and is typically a highly qualified
Range safety includes ensuring frequency de-confliction prior to and during application execution as well as airspace de-confliction. This individual will be trained in the use and operation of a spectrum analyzer to ensure that the communications and aircraft operations frequencies are not conflicting with other potential operations in the area. This individual will also monitor air traffic channels to ensure that the airspace remains free during the task. This individual will be responsible for coordinating with the air traffic management personnel in advance of the operation to ensure that the appropriate airspace restrictions are communicated to piloted aircraft operating in the area. This individual may also be responsible for aircraft launch and recovery operations as well as any required maintenance (e.g. refueling or repairs) in between flights.

3) **Launch and Recovery Assistants [$15/hr. fully loaded cost per 1.0 FTE]**: In the case of some larger unmanned aircraft operating in unimproved areas (e.g., group 3 UAS), one or two assistants may be required to help position the aircraft onto the launch system (e.g., catapult) and to recover the aircraft from the capture mechanism (e.g., snag line). This person can also be used for refueling and reloading of packages.

4) **Package Handlers [$15/hr. fully loaded cost per 1.0 FTE]**: This individual is responsible for ensuring the correct package is ready for the aircraft and for loading the package. This person can also be used for launch and recovery or for refueling.

5) **Safety Pilot [$35/hr. fully loaded cost per assigned FTE]**: This individual is responsible for bringing the aircraft safely in for recovery. For this competition, we will assume line-of-sight (LOS) during takeoff and landing, meaning that the safety pilot will need to be able to observe the aircraft during takeoff and landing. During semi-autonomous flight operations, the safety pilot is responsible for immediately taking over command of the aircraft and bringing it safely to the ground should it exhibit unanticipated flight behaviors, or in the case of piloted aircraft entering the flight operations area as communicated by the range safety officer. This role is also referred to as the “Observer,” responsible for maintaining VLOS with the aircraft during takeoff and landing.

6) **Operational Pilot [$35/hr. fully loaded cost per 1.0 FTE]**: In the case of autonomous or semi-autonomous operations, the operational pilot is responsible for monitoring aircraft state (attitude, altitude, and location) to adjusting aircraft flight path as required for success of the application task. The pilot will typically spend most of the operation looking at a screen at the ground control station monitoring the telemetry from the aircraft’s on-board flight control computer, and adjusting the aircraft’s programming as necessary.

7) **Air Traffic Manager [$35/hr. fully loaded cost per 1.0 FTE]**: In the case of using multiple aircraft, this person is responsible for coordinating the takeoff and landing of aircraft from the Central Hub. They are responsible for making sure aircraft do not crash into each other during takeoff and landing and prioritize which aircraft need to land first. In the event of an aircraft low on fuel or requiring an emergency landing, they adjust the flight logistics, rerouting other flights, to
prioritize for an emergency. This position becomes more important the more aircraft that you have flying at the same time.
IX. Other Information

Communications Considerations
You will want to provide a detailed description of how you will maintain communication and coordination among all the aircraft, ensure safety, and fully cover the subject area.

Spectrum Authorization and Transmission Rules
In the FAA Notice 8900.227 Unmanned Aircraft Systems (UAS) Operational Approval, there are several important considerations necessary to use communications equipment.

1. Every user (operator) must have the appropriate National Telecommunications and Information Administration (NTIA) or Federal Communications Commission (FCC) authorization or approval to transmit using radio frequencies (RF). These RF are used in the uplink and downlink portion of the UAS communications for transmission and receipt of control commands, telemetry, and sensor/payload information. This is achievable using licensed bands, which require an operator license such as an Amateur Radio License – Technician Class (valid for ten years). Be aware that each license type has restrictions concerning the use of specific frequencies and transmission power limits.

2. Non-Federal public agencies (other public entities and civil UAS users) generally require an FCC approved license to transmit on frequencies other than the unlicensed bands (900 MHz, 2.4 GHz, and 5.8 GHz). However, keep in mind that there are limitations on the transmission power used by unlicensed operators on the unlicensed bands (see Part 15 of the Code of Federal Regulations Title 47 regarding Radio Frequency Devices and their technical requirements). It should be noted that in accordance with 47 CFR 97, §97.215 Telecommand of model craft, an amateur station transmitting signals to control a model craft may be operated as follows:
   a. The station identification procedure is not required for transmissions directed only to the model craft, provided that a label indicating the station call sign and the station licensee's name and address is affixed to the station transmitter.
   b. The control signals are not considered codes or ciphers intended to obscure the meaning of the communication.
   c. The transmitter power must not exceed 1 Watt (W).

3. Department of Defense (DOD) agencies typically demonstrate UAS spectrum authorization through a Special Temporary Authorization (STA) issued by the NTIA or a frequency assignment in the Government Master File (GMF).

4. Non-DOD Federal public agencies (e.g., NASA, USCG, and USCBP) also require an STA issued by the NTIA or frequency assignment in the GMF.

Preventing Interference
When operating multiple aircraft or in close proximity to other aircraft in an area you will need to prevent communications interference among the various aircraft and the ground control. This can be accomplished using a variety of methods, including use of frequency hopping equipment, frequency management, staggering flights, and directional tracking antennae. The following figure depicts six UAS
operating in a five mile by five mile subject area using low-power communications (one mile range) and
the resulting interference that could occur from overlapping coverage.

Figure 16. Six UAS with low-power communications operating in subject area (interference).

Use of Multiple Antennae
It is possible to use multiple communication paths with a single aircraft through employment of a
multiplexer device onboard the UAV. A multiplexer is a device that provides a user with the ability to
select one of several inputs and designate as the primary (single) signal. Using such a device makes it
possible to monitor the received signal strength indication (RSSI) of each input and select the one with
the least noise, strongest signal, or most reliable signal (strongest over time; averaged). In many cases
these devices can be configured to monitor RSSI and automatically select one that meets desired
conditions (e.g., least noise, strongest, reliable). When a multiplexer is integrated into a communication
system, it becomes possible to use several transmitters from the ground control station; each fitted with
their own antenna. This strategy can be employed to support use of omni-directional (circular radius)
and directional antennae (e.g., Yagi-Uda, lens, or patch). The following figure depicts use of a
multiplexer device (in red) to support both line of sight (LOS) and beyond line of sight (BLOS)
communications.
**Use of Tracking Antenna**

Tracking antenna feature a moving base that can change the pitch and yaw (heading) of the antenna or antennae. They can be manually controlled by hand or automated through use of telemetry. In order to automate, the position and orientation of both the tracking antenna and the UAV (air vehicle element) must be known and communicated to the ground control station. Using geometry-based algorithms the ground control station will determine the appropriate pitch and yaw to orient the tracking antenna so that it points at and tracks the aircraft while in flight (see the following figure).
In addition, directional (highly focused; e.g., patch, Yagi-Uda, or lens) antenna can also be used in combination with a tracking and pointing base to avoid occurrences of interference by maintaining either vertical or horizontal separation (see the following figure).

Figure 18. Tracking Antenna example.
Figure 19. Multiple aircraft and directional antenna separation example.
X. Business Case Guidelines

This year’s business case will assume you have won a contract with single business does package delivery in an urban setting. In order to get more packages out the company you have a contract with have gotten permission to deliver some packages in a designated area using Unmanned Aerial Vehicles (UAV’s). Your company has been contracted to handle the UAV deliveries in the designated area approved by the city. This year broader marketing will not be considered. Instead teams will be working within a single contract put out by a company. Your teams company has been given a rate of pay per package along with several other incentives to deliver a greater number of packages seen in the subsection on pay rates. Since the business goal is around a single contract, you will be doing cost analysis to determine if and when your plan for performing the contracted work will be profitable. Costs and profitability will only deal with work completed for the requirements for the contract. Fixed costs, variable costs, and profits will all be calculated using formulas below. The business goal is to analyze if the plan for performing the contracted work to make sure that your business will be profitable. Keep in mind many businesses will take some time to become profitable and reach a break-even point (additional information explained below). The following is an elaboration of the five key components of a business case that will assist you in being profitable in your contracted work. Think of following key components of a business case to help you develop your business case section:

1. Provides the rationale for proposed budget

2. Explains the means by which the project will complete the required objectives effectively

3. Outlines the overall feasibility and risks

4. Explains why the proposed solution/budget is the best choice for the contract

5. Provides the overall scope, timeframe, and how budget were planned to become profitable

Pay Rates
This year you will be assuming that you will be doing the same number of deliveries of packages each day and to the same locations. Each Day is measured as 12 hours to complete all package deliveries. Your team is going to be paid a flat rate of $150 for delivering packages in the area that you have been contracted to service. In addition to this standard rate the company has given the opportunity for you to earn a bonus for certain delivery accomplishments. These bonuses are an incentive to encourage you to perform additional tasks that they would like you to do in your delivery plan that will help the contracting company earn more money or become more profitable by saving them money. The bonuses will be made in addition to your normal rate per package. The additional incentives are:

Volume Bonus
Delivering more packages. You will be paid a flat bonus for the package that is delivered at these thresholds. The bonuses are added to one another as you deliver more packages as seen in the example
below. Teams are only able to get each of the bonuses for each day's work. Teams will not for instance earn the $500 for 50 or more packages again when they hit 100 packages delivered.

- 50 Packages: $500
- 100 Packages: $1,500
- 500 Packages: $10,000
- 1,000 Packages: $25,000

Example of bonus for more packages: (250X $150 (per delivery rate)) +$1,000 (Bonus for completing 50 deliveries)+ $1,500 (Bonus for completing 100 deliveries)= $40,000

**Pay Rate Formula**

The following formula is to calculate your total pay for completing your deliveries for a day. This information will be important for section 4.1.3 of your notebook and will also be important when performing calculations for your break-even analysis.

\[
\text{Total Income per Day} = \text{Number of packages delivered} \times 150 + \text{Volume Bonuses}
\]

**Cost Analysis**

Teams will be doing an analysis of their costs in order to determine if they will be able to become a profitable business. These costs are a factor in deciding if your design is a viable solution to doing the business that you are doing. If your design costs do not allow you to be profitable, even over a long period of time, your business will not be successful and will fail.

**Operating Costs (Variable Costs)**

This includes the cost of the personnel required for flights and support of your system and the cost of the fuel for flying. While there will only be one line item for all operating costs in the budget summary it will still be important that you document the following areas in your notebooks:

1. The cost of flying one day of package delivery, including the breakdown of what is included.
2. Understand how the differences in the cost to fly your UAS in each of the possible delivery areas affected your choice in the areas you chose to deliver to.

**Calculating Operating Costs**

**Operating costs for the Day** = Daily Cost of Personnel* + Daily Cost of Fuel

*Daily Cost of Personnel= Hourly wage for all personnel required to fly, reload, refuel, etc the UAV(s) during the course of the day. You should assume that people you are having work for you are paid for the entire time on site regardless of if they have tasks they need to accomplish at any particular time. A day is 12 hours unless you choose not to fly for the entire day. If you have personnel leave early you need to explain why their presence is not required to complete the tasks during that given time frame.

**Fixed Costs (Equipment and Supply Cost)**

This includes any equipment and support equipment you need to perform deliveries. There should be a breakdown of the fixed costs into the following categories, giving the total cost of all parts in each area as well as the total for the fixed costs:
**Airframe Costs**
Includes the engine and any component of the aircraft other than communication equipment and sensors.

**Sensor Costs**
Cost of all components related to the sensors used for the detection, obstacle avoidance or any other sensor the UAV utilizes.

**Command, Control, Communication Costs (C3)**
Costs include any equipment on the ground or on the UAV used for communicating between the controller and the aircraft.

**Support Equipment Costs**
Includes any additional equipment required for the system such as trailers, launch systems, or spare batteries.

**Calculating Fixed Costs**
To calculate Fixed costs you must add up the costs of all components of your aircraft.

\[
\text{Fixed costs} = \text{Air Frame Costs} + \text{Sensor Costs} + \text{Command Control Communications Costs} + \text{Support Equipment Costs}
\]

**Profit Analysis**
The first step to be able to determine if you will have profitable company is to determine if you are able to cover your operating costs and have a net income per day. Below is a formula to determine if you are able to pay for your operating costs in order to eventually become profitable. If your Net Income per day is negative you are not profitable and you should try to find a way to adjust your costs to make that number positive.

\[
\text{Net Income per day} = \text{Total income per day} - \text{Operating costs per day}
\]

**Break Even Analysis**
When determining if your you have a viable business you need to determine if you will be able to pay for both your operating costs and be able to pay back your fixed costs at some point. Based on how much you are making each day what day will you “Break Even” or pay for all of your fixed costs from your net income. To figure out when your company breaks even you must first figure out what your fixed costs are. Your fixed costs figure will determine how much you will have to make in profits in order to break even. Break even refers to having paid for what ever your initial investment is to pay for all of your fixed costs needed to operate. The formula below will calculate the break-even point or number of days to reach profitability:

\[
\text{Number of Days to Break Even} = \frac{\text{Fixed costs}}{\text{Net income per day}}
\]
**Feasibility and Risk**
Can your design perform how you say it will when completing these objectives? Are you adequately accounting for safety to meet the mission requirements adequately? Are you able to perform the tasks better/more profitably? Have you adequately accounted for the mission requirements so your aircraft can operate safely? Before attempting to convince the city your team is capable of developing and launching this plan, you must be convinced yourself. It is at this stage of developing the plan and the business case that experience counts. If you are not certain of the risks or of your own capability, don’t neglect to reach out to subject matter experts. Risks can get in the way of successfully completing the mission objectives while meeting the mission requirements. Be sure, therefore, to intensively brainstorm possible risks. You do not want to leave something out of your business case, or be asked something by a reviewer—and are unable to give an answer.

**Cost/Benefit Analysis**
When you are researching what options are available to the city you should keep track of the costs of different ways to do the job(s) your UAV can do. Use your research to assess the how the missions your UAS does compare with the ways those tasks are done with alternative parts. Explain how your UAS accomplishes its missions either better or cheaper. Explain why you chose the components included on your UAS. Describe how the components of your design add value by either completing more objectives or improving the overall performance of the system. Explain how you balanced higher performance of expensive components with an increased cost of components. Also make sure to explain how meeting the mission requirements effected your design decisions.
XI. 3D CAD Model Requirements

Three-dimensional CAD models are provided to represent the baseline example unmanned aircraft platforms included in the challenge. Each team is encouraged to modify these models to be graphically representative of any unmanned aircraft designs included in their submission. It is also permissible to custom create a 3D CAD model in Creo for each unmanned aircraft design. The finished 3D CAD model must meet the following requirements (i.e., basic items to keep in mind when designing for 3D printing):

NOTE: When you are designing a 3D model for print or video there is little need to pay any attention to reality. Most scenes and objects will only contain the meshes that are visible; objects do not need to physically connect.

1. Objects must be closed: 3D printing companies like to call this being 'watertight'. It can sometimes be a pain to identify where this problem occurs in your model.
2. Objects must be manifold: The full definition of manifold is quite mathematic. For our purposes, a mesh will become non-manifold if it has edges that are shared between more than two faces (see Figure 20. 3D cubes with one common edge).

![Figure 20. 3D cubes with one common edge.](image)

3. Observe the maximum size and wall-thickness: The maximum size of your object and the minimum wall-thickness depend on the production method that you are planning to use.
4. Correct normal: All surfaces of your model should have their “normal” pointing in the correct direction. When your model contains inverted “normal” 3D printers cannot determine the inside or outside of your mesh or model.

While modeling for 3D Printing is quite different from 'traditional', it is not difficult - if you keep the constraints in mind from the start.
XII. Additional Information and Resources

- RWDC Content Webinars
  - Overview of Unmanned Systems
  - Systems Engineering and Vehicle Performance Factors
  - Unmanned Systems in an Urban Setting
  - Business Case and Cost Considerations
- RWDC Site with FAQs, tutorials, material allowables, and other supporting materials: [http://www.realworlddesignchallenge.org/](http://www.realworlddesignchallenge.org/)
- The following represent the recommended baseline remote air vehicle element (i.e., UAV) platforms for this challenge:
  - Fixed-wing Pusher UAS Design
  - Fixed-wing Tractor UAS Design
  - Rotary-wing UAS Design
  - Multirotor UAS Design
  - Hybrid UAS Design
- Mentors from the aerospace and defense industry, government agencies and higher education
- Baseline CAD models for each baseline remote vehicle element to be provided

**PTC Tools**
- PTC Creo 2.0
- Excel calculator tool

**Team Submissions**
The Engineering Design Notebook submission including the business plan and appendices must be 80 pages or less. Detailed information regarding what must be documented can be found in the Scoring Rubric.

**Scoring**
- Teams’ submissions will be evaluated based on criteria outlined in the RWDC FY19 State Challenge Scoring Rubric and in reference to the example mission scenario
- Technical scoring will be based on deliverables to be incorporated in the Engineering Design Notebook
- Engineering Design Notebooks should follow the paragraph order of the Scoring Rubric
- Judges will be looking for ability to express comprehension and linkage between the design solutions with what students have learned
- Specific recognition will be given for design viability, manufacturability, innovation, and business plan development
- **Hub**
- **Road**
- **Delivery neighborhood with max number of packages per day**
- **No Fly Zone**
- **Tall buildings with minimum flying height in meters**
